

Regular Expressions

Regular Expressions

- Used to match text rather than filenames
- Similar to glob expressions, but much more powerful
- Uses:
 - Search files for text
 - Edit text (patterns for search and replace)
 - Validate input in programs, webforms, etc
 - Match lines to control AWK scripts
 - Specify elements of the syntax of a programming language
- Most regular expressions used with bash must be quoted

Regular Expression Syntax (1)

- `*` matches 0 or more of the preceding expression
- Examples

| Regex | Matches |
|--------------------|--|
| <code>a*</code> | a, aa, aaa, aaaa, etc, and the empty string |
| <code>abc*</code> | ab, abc, abcc, abccc, etc |
| <code>ab*c</code> | ac, abc, abbc, abbbc, etc |
| <code>(ab)*</code> | ab, abab, ababab, etc, and the empty string (Parentheses are used for grouping) |

Regular Expression Syntax (2)

- `+` matches 1 or more of the preceding expression
- Examples

| Regex | Matches |
|--------------------|------------------------------------|
| <code>a+</code> | <code>a, aa, aaa, aaaa, etc</code> |
| <code>abc+</code> | <code>abc, abcc, abccc, etc</code> |
| <code>ab+c</code> | <code>abc, abbc, abbbc, etc</code> |
| <code>(ab)+</code> | <code>ab, abab, ababab, etc</code> |

Regular Expression Syntax (3)

- `.` matches any single character (except newline)
- `[]` is the same as in glob expressions
- `?` makes the previous expression optional (0 or 1 occurrences)
- Examples:

| Regex | Matches |
|----------------------|------------------------------------|
| <code>[a-z].*</code> | Strings beginning with a letter |
| <code>[0-9]+</code> | Integers |
| <code>[^0-9]*</code> | Strings that don't contain a digit |
| <code>.??.??</code> | Strings of length 0, 1, 2, or 3 |

Regular Expression Syntax (4)

- $\{n\}$ matches n of the previous expression
- $\{m, n\}$ matches m through n of the previous expression
- $\{n, \}$ matches n or more of the previous expression
- $\{, n\}$ matches n or fewer of the previous expression
- $r_1 | r_2$ matches like r_1 or r_2

| Regex | Matches |
|---------------------------------|---|
| $\{5\}$ | strings of length 5 |
| $(\{3\})^*$ | strings whose length is a multiple of 3 |
| $foo bar$ | matches foo or bar |
| $image \setminus . (png jpg)$ | matches image.png or image.jpg |

Using Regular Expressions with Egrep

- `egrep regexp` displays lines from stdin containing a match for `regexp`
- `egrep regexp file ...` displays lines from the files matching a match for the `regexp`
- Egrep Options

| | |
|-----------------|--|
| <code>-i</code> | ignore case |
| <code>-v</code> | display lines that don't match |
| <code>-c</code> | count the lines that match |
| <code>-l</code> | display the names of files with a match |
| <code>-q</code> | print nothing - set exit status to 0 if there's a match otherwise 1 |
| <code>-x</code> | Only display lines that are an exact match (instead of containing a match) |

Egrep Examples

- `egrep foobar infile` prints lines from infile containing foobar
- `egrep '^.....$' infile` prints lines from infile of length 6
- `egrep '^ ' infile` prints lines from infile that start with a space
- `egrep '^ [0-9]+$'` prints nonempty lines from stdin containing only digits
